Subject: Sample containers

Hi Lisa, an update to what we have been talking about for planning the sampling. I calculated you will need 150 containers for 25 soil and sediment samples. This also corresponds to 150 tags. For the three water samples I estimate another 20 containers. That is 170 containers in total, and we need to have some extras in case of breakage. As soon as Glenn gets things organized in the basement and as soon as you can, let's go through the bottles and jars that we have in stock and prepare a list of what we need to order. We need to fill out the document request form to order tags, labels, and COCs. And, as you know for this Friday, if we can, we will need to submit the CLP request form. Call me when you get a chance. Then we should get together in the basement and go through all the PPE and sampling supplies, bags, gloves, scoops, etc, so we will have time to order what we need.

I was finally able to talk with Leandro today. He gave me a little more information about the wells but still does not have access permission from the owners, nor any specific details about these wells. I told him about the deadline of this Friday for the lab space request. He said he would try to get us the information we need before then. Linda
